Background

- Functional testing prior to intervention of epicardial CAD has been shown to be efficacious, safe and cost-effective.
- A substantial proportion of vessels (20-30%) show residual ischemia (FFR ≤ 0.80) *after angiographically successful PCI.*
- The final post-PCI FFR value is associated with long term outcomes (“higher is better”).
- Further interventions in vessels with low FFR after angiographically successful PCI can improve the functional outcome of PCI.

SCAI

Society for Cardiovascular
Angiography & Interventions

Non-hyperemic pressure ratios (NHPR) post-PCI

- No NHPR post-PCI has been validated or formally studied prospectively to guide clinical decision-making.
- While the diagnostic performance of virtually all NHPRs including Pd/Pa, iFR, RFR is ~ 80% when compared with FFR pre-PCI, it is not known whether the comparative effectiveness of NHPRs vs FFR is the same after PCI.

SCAI

Society for Cardiovascular
Angiography & Interventions

Objectives

- To study
 - a) the **comparative effectiveness** and
 - b) **diagnostic accuracy** of post PCI Pd/Paagainst the reference standard of FFR in identifying residual ischemia (FFR<0.80) in vessels having undergone angiographically successful PCI.

SCAI

Society for Cardiovascular
Angiography & Interventions

Three cohorts were studied to compare Pd/Pa vs FFR

1) Reference pre-PCI cohort

1560 vessels in 1255 patients undergoing pre-PCI Pd/Pa and FFR to study the *diagnostic accuracy of Pd/Pa vs FFR pre-PCI*.

2) Derivation post-PCI cohort

655 vessels in 574 patients to study the *diagnostic accuracy of post PCI Pd/Pa in identifying persistent ischemia (FFR<0.80)*

3) Prospective post-PCI validation cohort

255 vessels in 230 patients to validate Pd/Pa vs FFR post-PCI

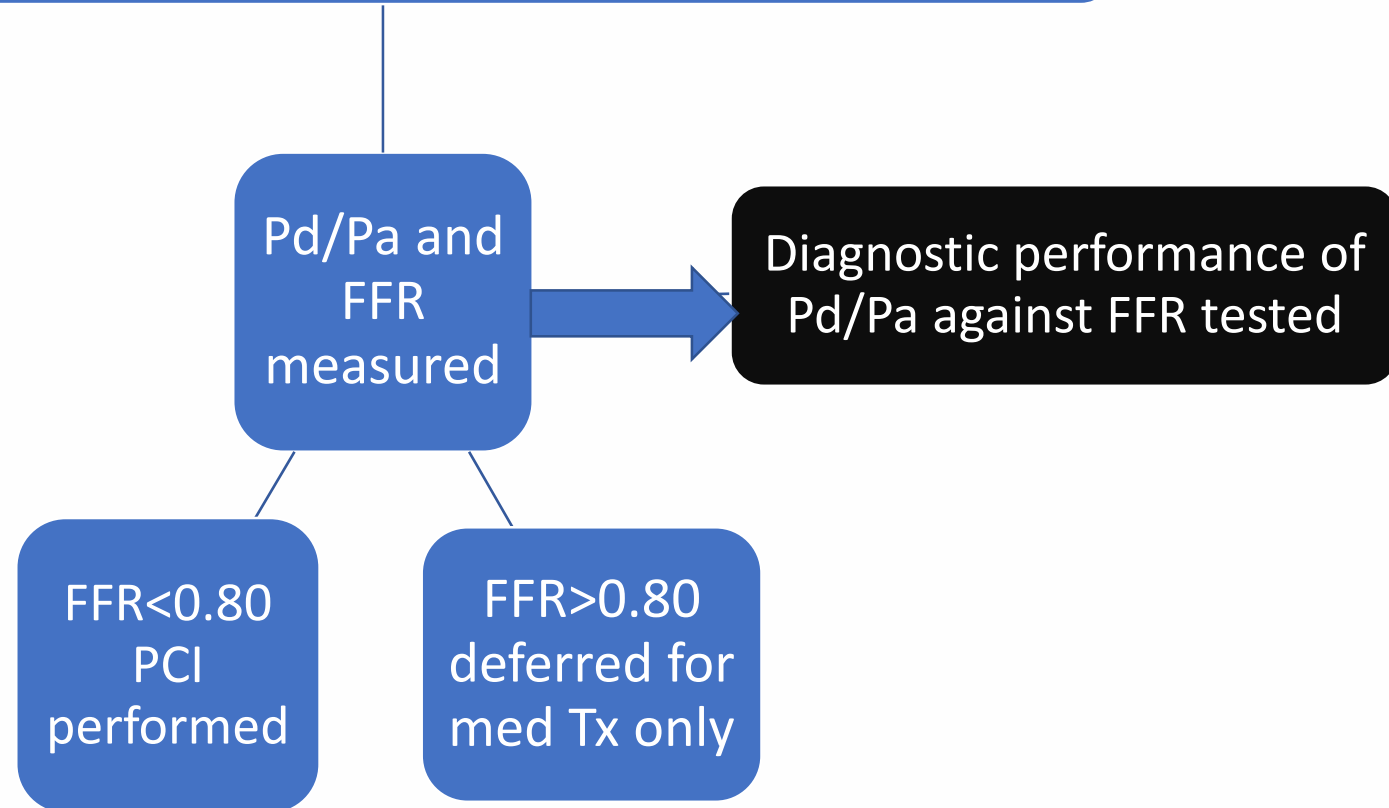

SCAI

Society for Cardiovascular
Angiography & Interventions

Reference pre PCI Cohort:

1560 vessels patients with 1255 vessels
undergoing invasive evaluation of CAD

SCAI

Society for Cardiovascular
Angiography & Interventions

Derivation post PCI Cohort

574 patients undergoing PCI in 664
ischemic lesions

PCI performed

Pd/Pa and FFR measured after PCI result deemed angiographically satisfactory

Diagnostic performance of Pd/Pa against FFR tested post PCI

SCAI

Society for Cardiovascular
Angiography & Interventions

Validation post PCI Cohort

230 patients undergoing PCI
in 255 ischemic lesions

PCI performed

Pd/Pa and FFR measured after PCI result deemed angiographically satisfactory

Diagnostic performance of Pd/Pa against FFR tested post PCI

Post PCI Pd/Pa and FFR

SCAI

Society for Cardiovascular
Angiography & Interventions

- Using the **hybrid strategy**, diagnostic accuracy is 95% with Negative Predictive Value (NPV) of 96% to diagnose residual ischemia post-PCI.
- Adenosine can be avoided in >75% patients using this strategy.

SCAI

Society for Cardiovascular
Angiography & Interventions

Conclusions

- Pd/Pa has excellent diagnostic accuracy in identifying residual ischemia and confirming a physiologically successful outcome in patients undergoing angiographically successful PCI.
- Diagnostic accuracy can be further improved by incorporating a hybrid strategy requiring adenosine in only 25% of patients.
- Further studies are needed to establish the role of Pd/Pa in clinical decision-making after angiographic optimization to improve functional outcome of PCI.
