Bristol-Myers Squibb

Background

- The optimal antithrombotic regimen for patients with atrial fibrillation (AF) who have an acute coronary syndrome (ACS) or require percutaneous coronary intervention (PCI) is unclear
- Prior studies were designed to identify strategies to reduce the bleeding associated with triple antithrombotic therapy
 - WOEST (n=573): less bleeding AND fewer ischemic events without aspirin compared with vitamin K antagonist (VKA) + dual antiplatelet therapy (DAPT)
 - PIONEER AF-PCI (n=2124): less bleeding with two reduced-dose rivaroxaban regimens compared with VKA + DAPT
 - RE-DUAL PCI (n=2725): less bleeding with two standard-dose dabigatran regimens, without aspirin, compared with VKA + DAPT
- There are limited data with apixaban in patients with AF requiring DAPT
- Data on the independent effects of aspirin in this population are needed

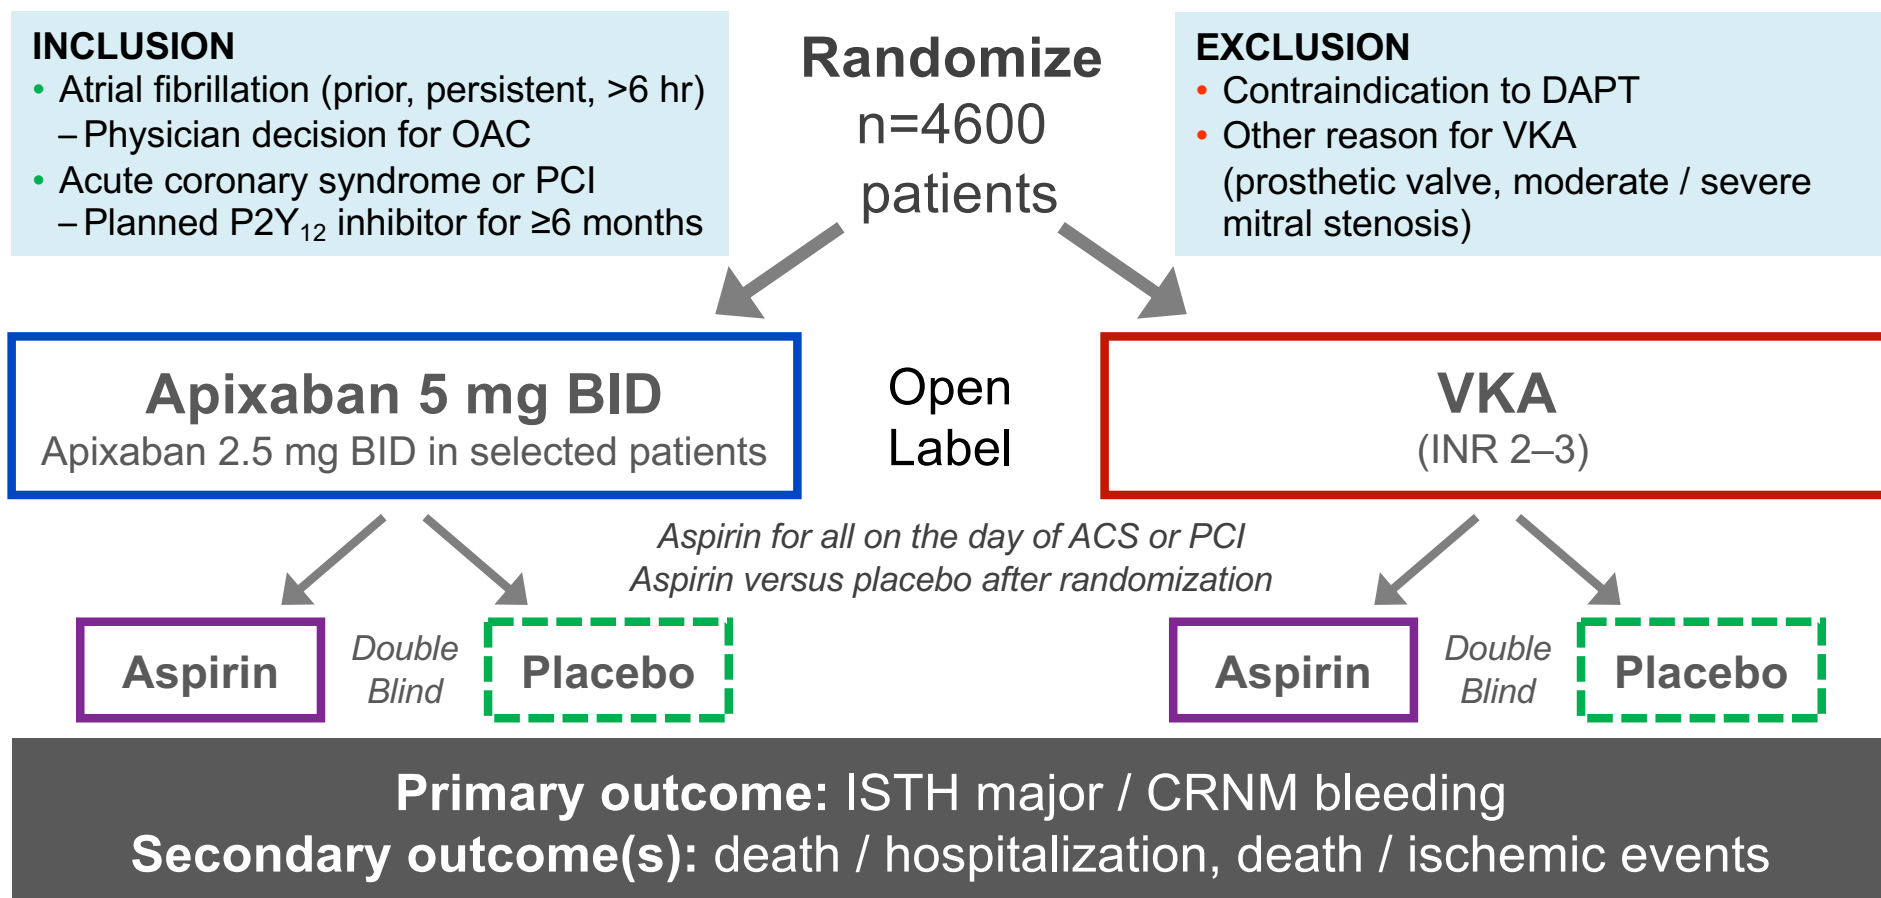

Dewilde WJ, et al. Lancet 2013;381:1107-15.
Gibson CM, et al. N Engl J Med 2016;375:2423-34.
Cannon CP, et al. N Engl J Med 2017;377:1513-24.

Two Independent Hypotheses

In patients with AF and ACS or PCI on a P2Y₁₂ inhibitor

1. Apixaban is non-inferior to VKA for International Society on Thrombosis and Haemostasis (ISTH) major or clinically relevant non-major (CRNM) bleeding
2. Aspirin is inferior to placebo for ISTH major or CRNM bleeding in patients on oral anticoagulation (OAC)

Participating Countries and Number of Patients

Primary Outcome

- **ISTH major bleeding**
 - Results in death
 - Occurs in critical area or organ
 - Results in hemoglobin drop ≥ 2 g/dL
 - Requires transfusion of ≥ 2 units of whole blood or packed red blood cells
- **Clinically relevant non-major bleeding**
 - Results in hospitalization
 - Requires medical / surgical evaluation or intervention
 - Requires physician-directed change in antithrombotic regimen

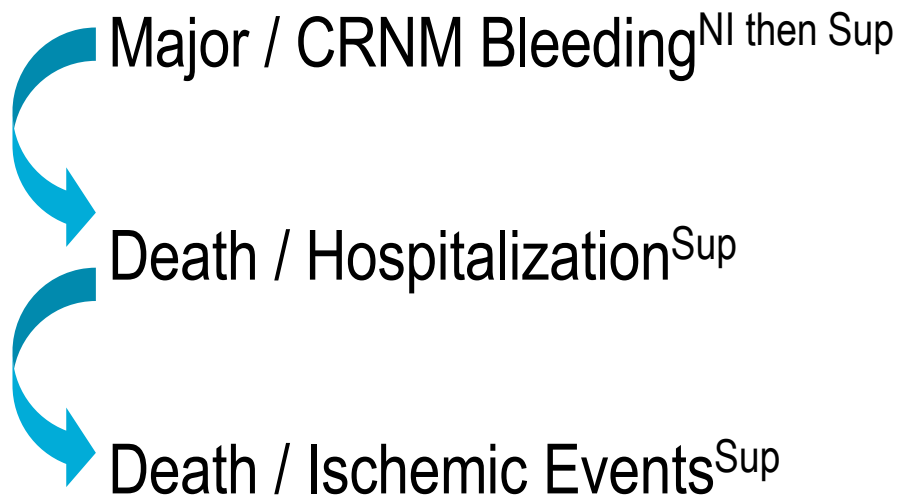

Secondary Outcomes

- **Death or Hospitalization**
- **Death or Ischemic Events**
 - Stroke, myocardial infarction, stent thrombosis (definite or probable), urgent revascularization

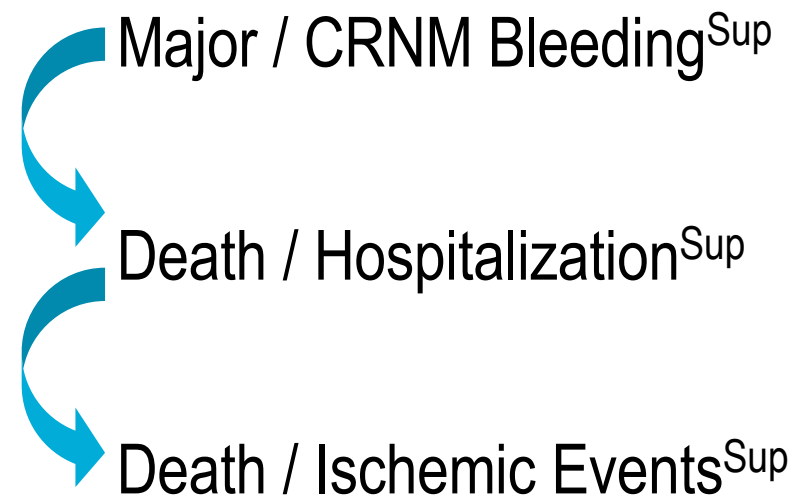

Statistical Analysis—Hierarchical Testing

Baseline Characteristics

	Total (N=4614)
Age, median (25 th , 75 th), years	70.7 (64.2, 77.2)
Female, %	29.0
CHA ₂ DS ₂ -VASc score, mean (SD)	3.9 (1.6)
CHA ₂ DS ₂ -VASc score, mean (SD)	3.9 (1.6)
HAS-BLED score, mean (SD)	2.9 (0.9)
Prior OAC, %	49.0
P2Y ₁₂ inhibitor, %	
Clopidogrel	92.6
Qualifying index event, %	
ACS and PCI	37.3
ACS and no PCI	23.9
Elective PCI	38.8

No Significant Interactions Between Randomization Factors

Apixaban / VKA vs. Aspirin / Placebo

- Major / CRNM Bleeding: $P_{\text{interaction}} = 0.64$
- Death / Hospitalization: $P_{\text{interaction}} = 0.21$
- Death / Ischemic Events: $P_{\text{interaction}} = 0.28$

Major / CRNM Bleeding

Apixaban vs. VKA

ARR: absolute risk reduction
NNT: number needed to treat

Major / CRNM Bleeding

Aspirin vs. Placebo

ARI: absolute risk increase
NNH: number needed to harm

Major / CRNM Bleeding

Death / Hospitalization

Apixaban vs. VKA

ARR: absolute risk reduction
NNT: number needed to treat

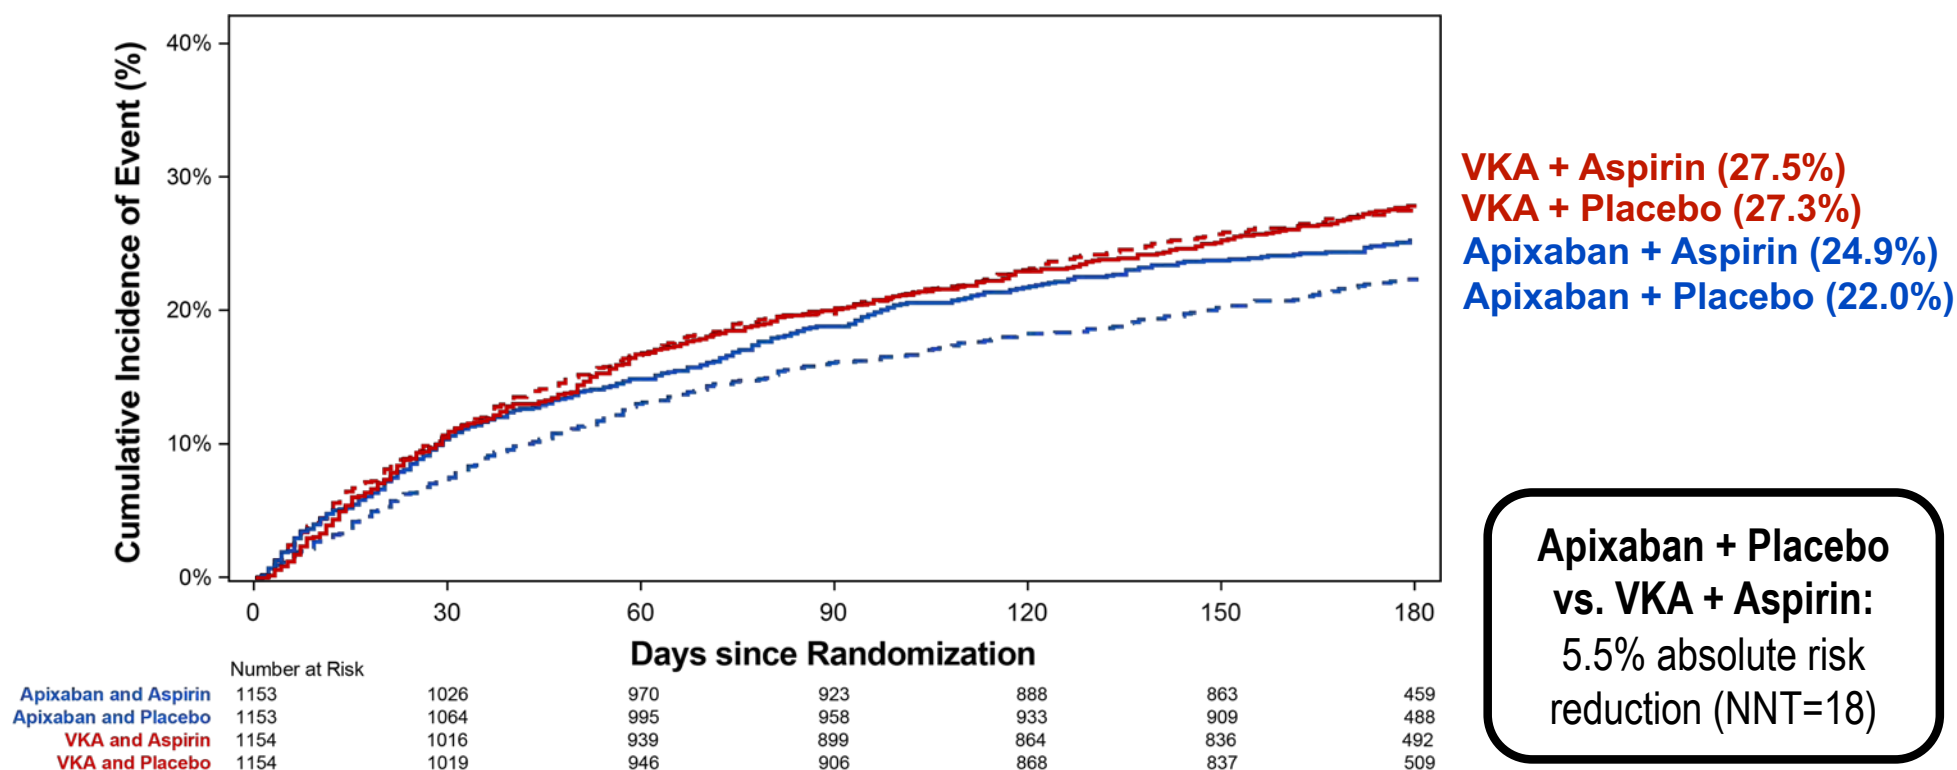

Death / Hospitalization

Aspirin vs. Placebo

Death / Hospitalization

Ischemic Outcomes

Apixaban vs. VKA

Endpoint	Apixaban (N=2306)	VKA (N=2308)	HR (95% CI)
Death / Ischemic Events (%)	6.7	7.1	0.93 (0.75–1.16)
Death (%)	3.3	3.2	1.03 (0.75–1.42)
CV Death (%)	2.5	2.3	1.05 (0.72–1.52)
Stroke (%)	0.6	1.1	0.50 (0.26–0.97)
Myocardial Infarction (%)	3.1	3.5	0.89 (0.65–1.23)
Definite or Probable Stent Thrombosis (%)	0.6	0.8	0.77 (0.38–1.56)
Urgent Revascularization (%)	1.7	1.9	0.90 (0.59–1.38)
Hospitalization (%)	22.5	26.3	0.83 (0.74–0.93)

Ischemic Outcomes

Aspirin vs. Placebo

Endpoint	Aspirin (N=2307)	Placebo (N=2307)	HR (95% CI)
Death / Ischemic Events (%)	6.5	7.3	0.89 (0.71–1.11)
Death (%)	3.1	3.4	0.91 (0.66–1.26)
CV Death (%)	2.3	2.5	0.92 (0.63–1.33)
Stroke (%)	0.9	0.8	1.06 (0.56–1.98)
Myocardial Infarction (%)	2.9	3.6	0.81 (0.59–1.12)
Definite or Probable Stent Thrombosis (%)	0.5	0.9	0.52 (0.25–1.08)
Urgent Revascularization (%)	1.6	2.0	0.79 (0.51–1.21)
Hospitalization (%)	25.4	23.4	1.10 (0.98–1.24)

Conclusion

In patients with atrial fibrillation and a recent acute coronary syndrome or PCI treated with a P2Y₁₂ inhibitor, an antithrombotic regimen that included apixaban, without aspirin, resulted in less bleeding and fewer hospitalizations without significant differences in ischemic events than regimens that included a vitamin K antagonist, aspirin, or both
