ACC Late-Breaking Clinical Trial presentation

AMERICAN
COLLEGE of
CARDIOLOGY

Background

Acetylsalicylic acid

2014 AHA/ACC NSTEMI-ACS Guidelines

I IIa IIb III

For patients who experience NSTEMI-ACS, a maintenance dose of aspirin **(81 mg/d to 325 mg/d)** should be continued indefinitely.

Research Question

In patients with established or pre-existing cardiovascular disease, is a strategy of 81 mg or 325 mg of aspirin better?

Everyday decision for patients
(OTC medication)

The correct dose of aspirin may **PREVENT**:

Thousands of deaths / heart attacks
or

Thousands of bleeds

Annually in the United States

Main Objectives of the ADAPTABLE Trial

To compare the effectiveness and safety of two doses of aspirin (81 mg and 325 mg) in high-risk patients with coronary artery disease.

- 📌 **Primary Effectiveness Endpoint:** Composite of all-cause mortality, hospitalization for MI, or hospitalization for stroke
- 📌 **Primary Safety Endpoint:** Hospitalization for major bleeding that was associated with a blood product transfusion

Statistical Considerations

Final Trial Sample Size = 15,000

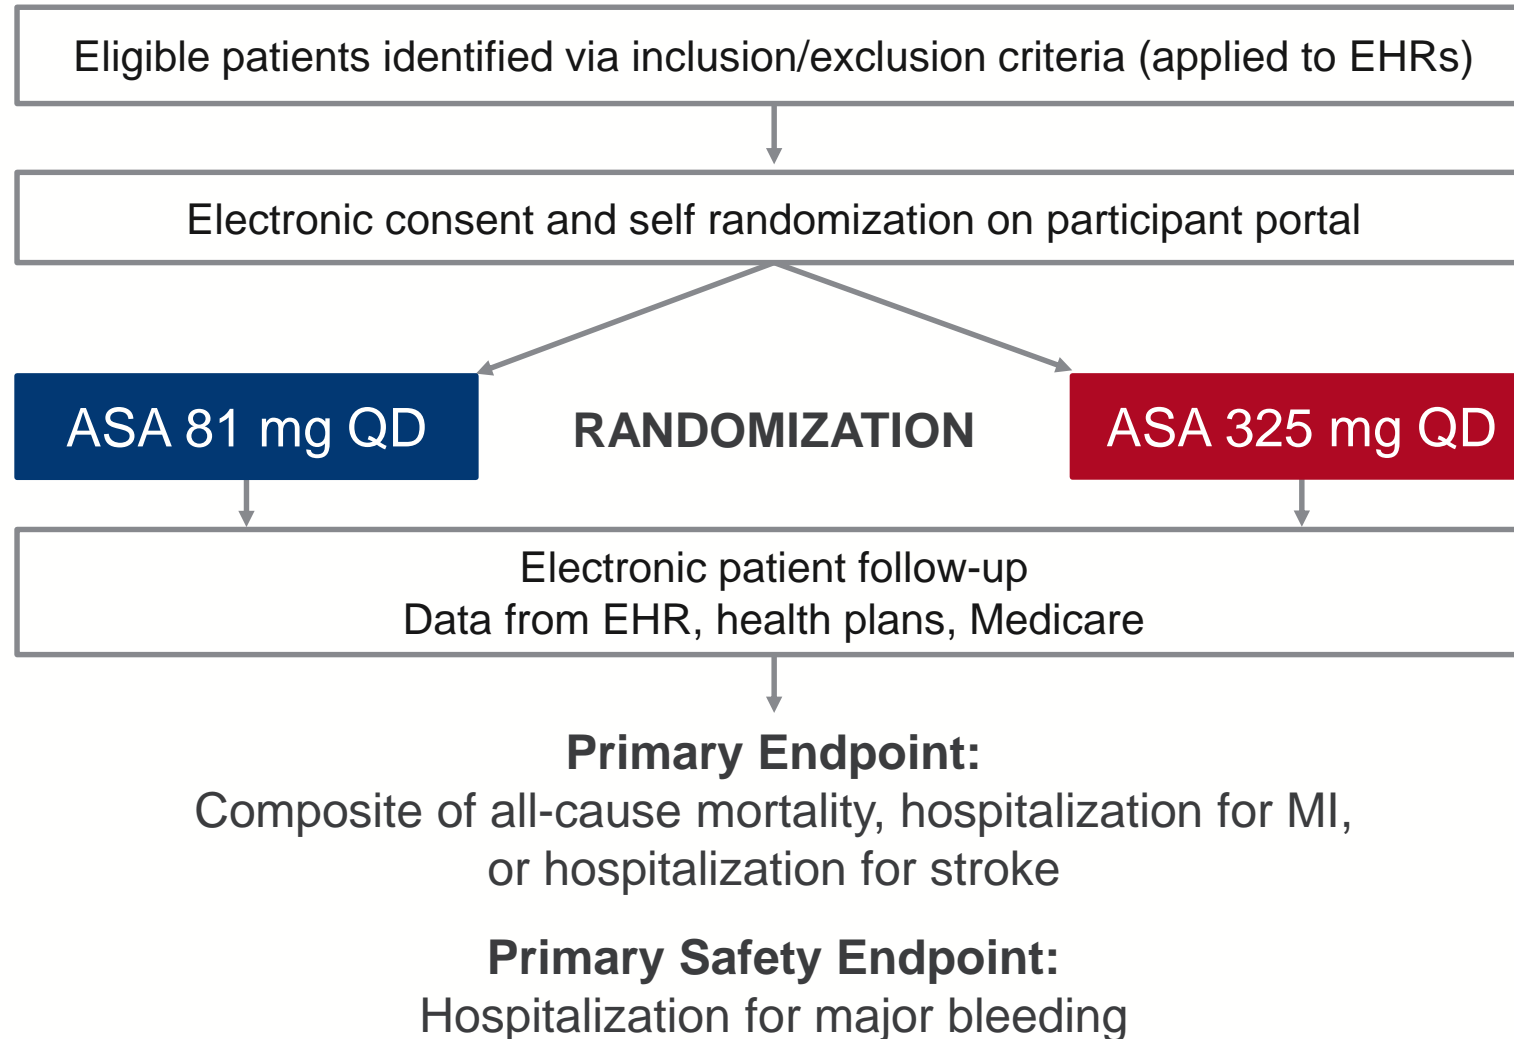

- At least 88% power to detect 15% RRR, assuming primary effectiveness outcome rate of 4.6% per year in higher-risk arm
- Minimum follow-up = 18 mo; maximum follow-up = 50 mo

Statistical Analysis Plan

- Intention-to-treat
- Cumulative event rates accounting for competing risks of death
- Cox proportional hazards models for event-free survival

ADAPTABLE Study Design

15,000 patients with known ASCVD + ≥ 1 “enrichment factor”

ADAPTABLE Inclusion Criteria

Known Cardiovascular Disease

- ✓ Prior myocardial infarction
- ✓ Prior revascularization (PCI or CABG)
- ✓ Prior angiogram showing significant CAD
- ✓ History of chronic ischemic heart disease, CAD, or ASCVD

≥ 1 Enrichment Risk Factor

- | | |
|-----------------------------|---|
| ✓ Age ≥ 65 years | ✓ Current smoker |
| ✓ Creatinine ≥ 1.5 mg/dL | ✓ Known LVEF < 50% |
| ✓ Diabetes mellitus | ✓ Chronic systolic or diastolic heart failure |
| ✓ Known 3-vessel CAD | ✓ SBP ≥ 140 (within past 12 mos) |
| ✓ Cerebrovascular disease | ✓ LDL ≥ 130 (within past 12 mos) |
| ✓ Peripheral artery disease | |

ADAPTABLE Exclusion Criteria

- ✗ History of significant allergy to aspirin
- ✗ History of GI bleeding within 12 months
- ✗ Bleeding disorder that precludes the use of aspirin
- ✗ Current or planned use of an oral anticoagulant or ticagrelor
- ✗ Female patients who were pregnant or nursing

PATIENT ENGAGEMENT PAVILION

For more than 40 years, doctors have been telling patients with heart disease to take aspirin. Now there is a nationwide study to determine the best dose of aspirin to prevent heart attacks or strokes for these patients.

The Adaptable team of local UFHealth researchers invites you to be part of the answer.

If you are **18 years** or older, can safely take **aspirin** and have been diagnosed with **heart disease**, you may qualify.

Study enrollment and followup will be done entirely **online** or over the **phone**. You will not have to visit a clinic for the study.

Participants will receive compensation for their time.

To enroll or for more information, call 352-294-8770.

Visit us online at AdaptablePatient.com/ and enter your unique code: H2XXX

81 mg (1.8%)

325 mg (3.4%)

Baseline Characteristics

	81 mg group	325 mg group
Age, median, (25th, 75th), years	67.7 (60.7, 73.6)	67.5 (60.7, 73.5)
Female sex, no. (%)	2307 (30.6%)	2417 (32.1%)
Race, Black or African American, no. (%)	664 (8.8%)	647 (8.6%)
Race, White, no. (%)	6014 (79.8%)	5976 (79.3%)
Hispanic ethnicity, no. (%)	249 (3.3%)	232 (3.1%)
Weight, median (25th, 75th), kg	90.0 (78.6, 103.6)	90.0 (78.2, 104.1)
Current Tobacco use, no. (%)	696 (9.2%)	686 (9.1%)
Aspirin use before study		
81 mg	5823/6850 (85.0%)	5724/6687 (85.6%)
162 mg	168/6850 (2.5%)	142/6687 (2.1%)
325 mg	845/6850 (12.3%)	812/6687 (12.1%)
Dual antiplatelet use at baseline	1570 (22.5%)	1511 (22.1%)

Medical History

	81 mg group	325 mg group
Prior PCI	3005 (40.0%)	2941 (39.1%)
Prior CABG	1786 (23.8%)	1741 (23.2%)
Prior myocardial infarction	2674 (35.6%)	2631 (35.0%)
Hypertension	6264 (83.3%)	6248 (83.1%)
Dyslipidemia	6472 (86.1%)	6474 (86.1%)
Diabetes mellitus	2820 (37.5%)	2856 (38.0%)
Atrial fibrillation	605 (8.0%)	628 (8.4%)
Congestive heart failure	1718 (22.8%)	1786 (23.8%)
Prior GI hemorrhage	455 (6.1%)	495 (6.6%)
Prior intracranial hemorrhage	98 (1.3%)	110 (1.5%)

Primary Effectiveness Endpoint

(All-cause death, hospitalization for MI, or hospitalization for stroke)

Primary Safety Endpoint

(Hospitalization for major bleeding with associated blood product transfusion)

Effectiveness and Safety Outcomes

	81 mg group N=7434	325 mg group N=7330	HR (95% CI)
Primary endpoint	590 (7.28%)	569 (7.51%)	1.02 (0.91 - 1.14)
Major bleeding	53 (0.63%)	44 (0.60%)	1.18 (0.79 - 1.77)
All-cause death	315 (3.80%)	357 (4.43%)	0.87 (0.75 - 1.01)
Non-fatal MI	228 (2.99%)	213 (2.87%)	1.06 (0.88 - 1.27)
Non-fatal stroke	102 (1.23%)	92 (1.27%)	1.09 (0.82 - 1.45)
PCI or CABG	471 (6.05%)	446 (5.96%)	1.04 (0.92 - 1.19)

Subgroup Analyses

(Primary effectiveness endpoint)

	81 mg dose N (Rate)	325 mg dose N (Rate)		HR (95% CI)
Overall	590 (7.28%)	569 (7.51%)		1.02 (0.91 - 1.14)
Age				
>= 65 yrs	364 (7.12%)	378 (7.96%)		0.94 (0.79 - 1.12)
< 65 yrs	226 (7.54%)	191 (6.80%)		1.24 (1.00 - 1.53)
Sex				
Female	186 (7.79%)	193 (8.43%)		0.99 (0.81 - 1.21)
Male	404 (7.06%)	376 (7.08%)		1.03 (0.90 - 1.19)
Race				
White	432 (6.70%)	433 (7.12%)		0.97 (0.85 - 1.11)
Black	91 (12.27%)	68 (10.69%)		1.36 (0.99 - 1.86)
Other	33 (6.88%)	33 (7.69%)		0.86 (0.53 - 1.39)
Ethnicity				
Hispanic	24 (7.67%)	14 (5.94%)		1.61 (0.83 - 3.11)
Not Hispanic	530 (7.26%)	513 (7.44%)		1.01 (0.89 - 1.14)
Diabetes				
No	283 (5.97%)	258 (5.82%)		1.06 (0.89 - 1.25)
Yes	288 (9.28%)	295 (9.99%)		0.99 (0.84 - 1.17)
Chronic kidney disease				
No	370 (5.82%)	347 (5.65%)		1.05 (0.90 - 1.21)
Yes	201 (13.73%)	206 (15.68%)		0.97 (0.80 - 1.18)
P2Y12 inhibitor use				
No	359 (5.87%)	361 (6.64%)		0.96 (0.83 - 1.11)
Yes	188 (11.49%)	161 (10.08%)		1.16 (0.94 - 1.44)
Study visit method				
Interent	439 (6.28%)	449 (6.70%)		0.97 (0.85 - 1.10)
Non-Internet	151 (13.73%)	120 (12.96%)		1.18 (0.93 - 1.50)

favors 81 mg dose favors 325 mg dose

Study Medication in ADAPTABLE

	Overall	81 mg	325 mg
Dose switching, % *	24.2%	7.1%	41.6%
Aspirin discontinuation, % **	9.1%	7.0%	11.1%
Median days of exposure, <u>assigned</u> aspirin dose	551 days (139 - 737)	650 days (415 – 922)	434 days (139 – 737)
Median days of exposure, <u>any</u> aspirin dose	658 days (426 - 932)	670 days (439 – 944)	646 days (412 – 922)

* Defined as at least one dose change

** Reasons for aspirin discontinuation:

25% participant did not want to continue

75% doctor's decision or medical condition (e.g., atrial fibrillation, dyspepsia)

Sensitivity Analyses

Outcome	81 mg dose N (rate)	325 mg dose N (rate)	HR (95% CI) 325 mg vs 81 mg
Impact of actual dose taken			
Death / MI / Stroke	673 (3.6 events per 100 patient-years)	321 (2.9 events per 100 patient-years)	1.25 (1.10 - 1.43)

Rates are calculated at median follow-up (26.2 months) using the Kalbfleisch & Prentice cumulative incidence function estimator.

Rates and HR reflect the effect of the time-varying reported dose on the primary effectiveness end point.

Rates are calculated as annualized event rates (events per 100 patient-years).

Strengths and Limitations

- 📍 We successfully completed this virtual, pragmatic study
- 📍 We performed this study in a real-world environment, utilized multiple, heterogeneous datasets, and engaged patient-partners to make our study better
- 📍 Open-label study
 - Inability to blind study drug may have affected adherence, dose switching, and drug discontinuation
- 📍 Improving diversity and inclusion remains an important goal and may not be fully addressed with virtual studies

Conclusions

- ❖ No observed difference in death / MI / stroke in patients assigned to 81 mg vs. 325 mg
- ❖ There was a difference in fidelity to the study dose/intervention (more dose switching in 325 mg group)
 - Multiple reasons that patients did not stay on the 325 mg dose
 - Tolerability
 - Medical reasons
 - Participant preferences
 - Clinician practices

Messages to Patients

- ❖ **If you are on 81 mg now**, staying (rather than switching) is probably right given the similar study results for the primary endpoint
- ❖ **If you are resuming aspirin**, starting a lower dose (81 mg) is probably right due to better tolerability and we did not find conclusive evidence that higher dose is better
- ❖ **If you are tolerating 325 mg now**, staying on this dose may be okay and associated with moderate benefit

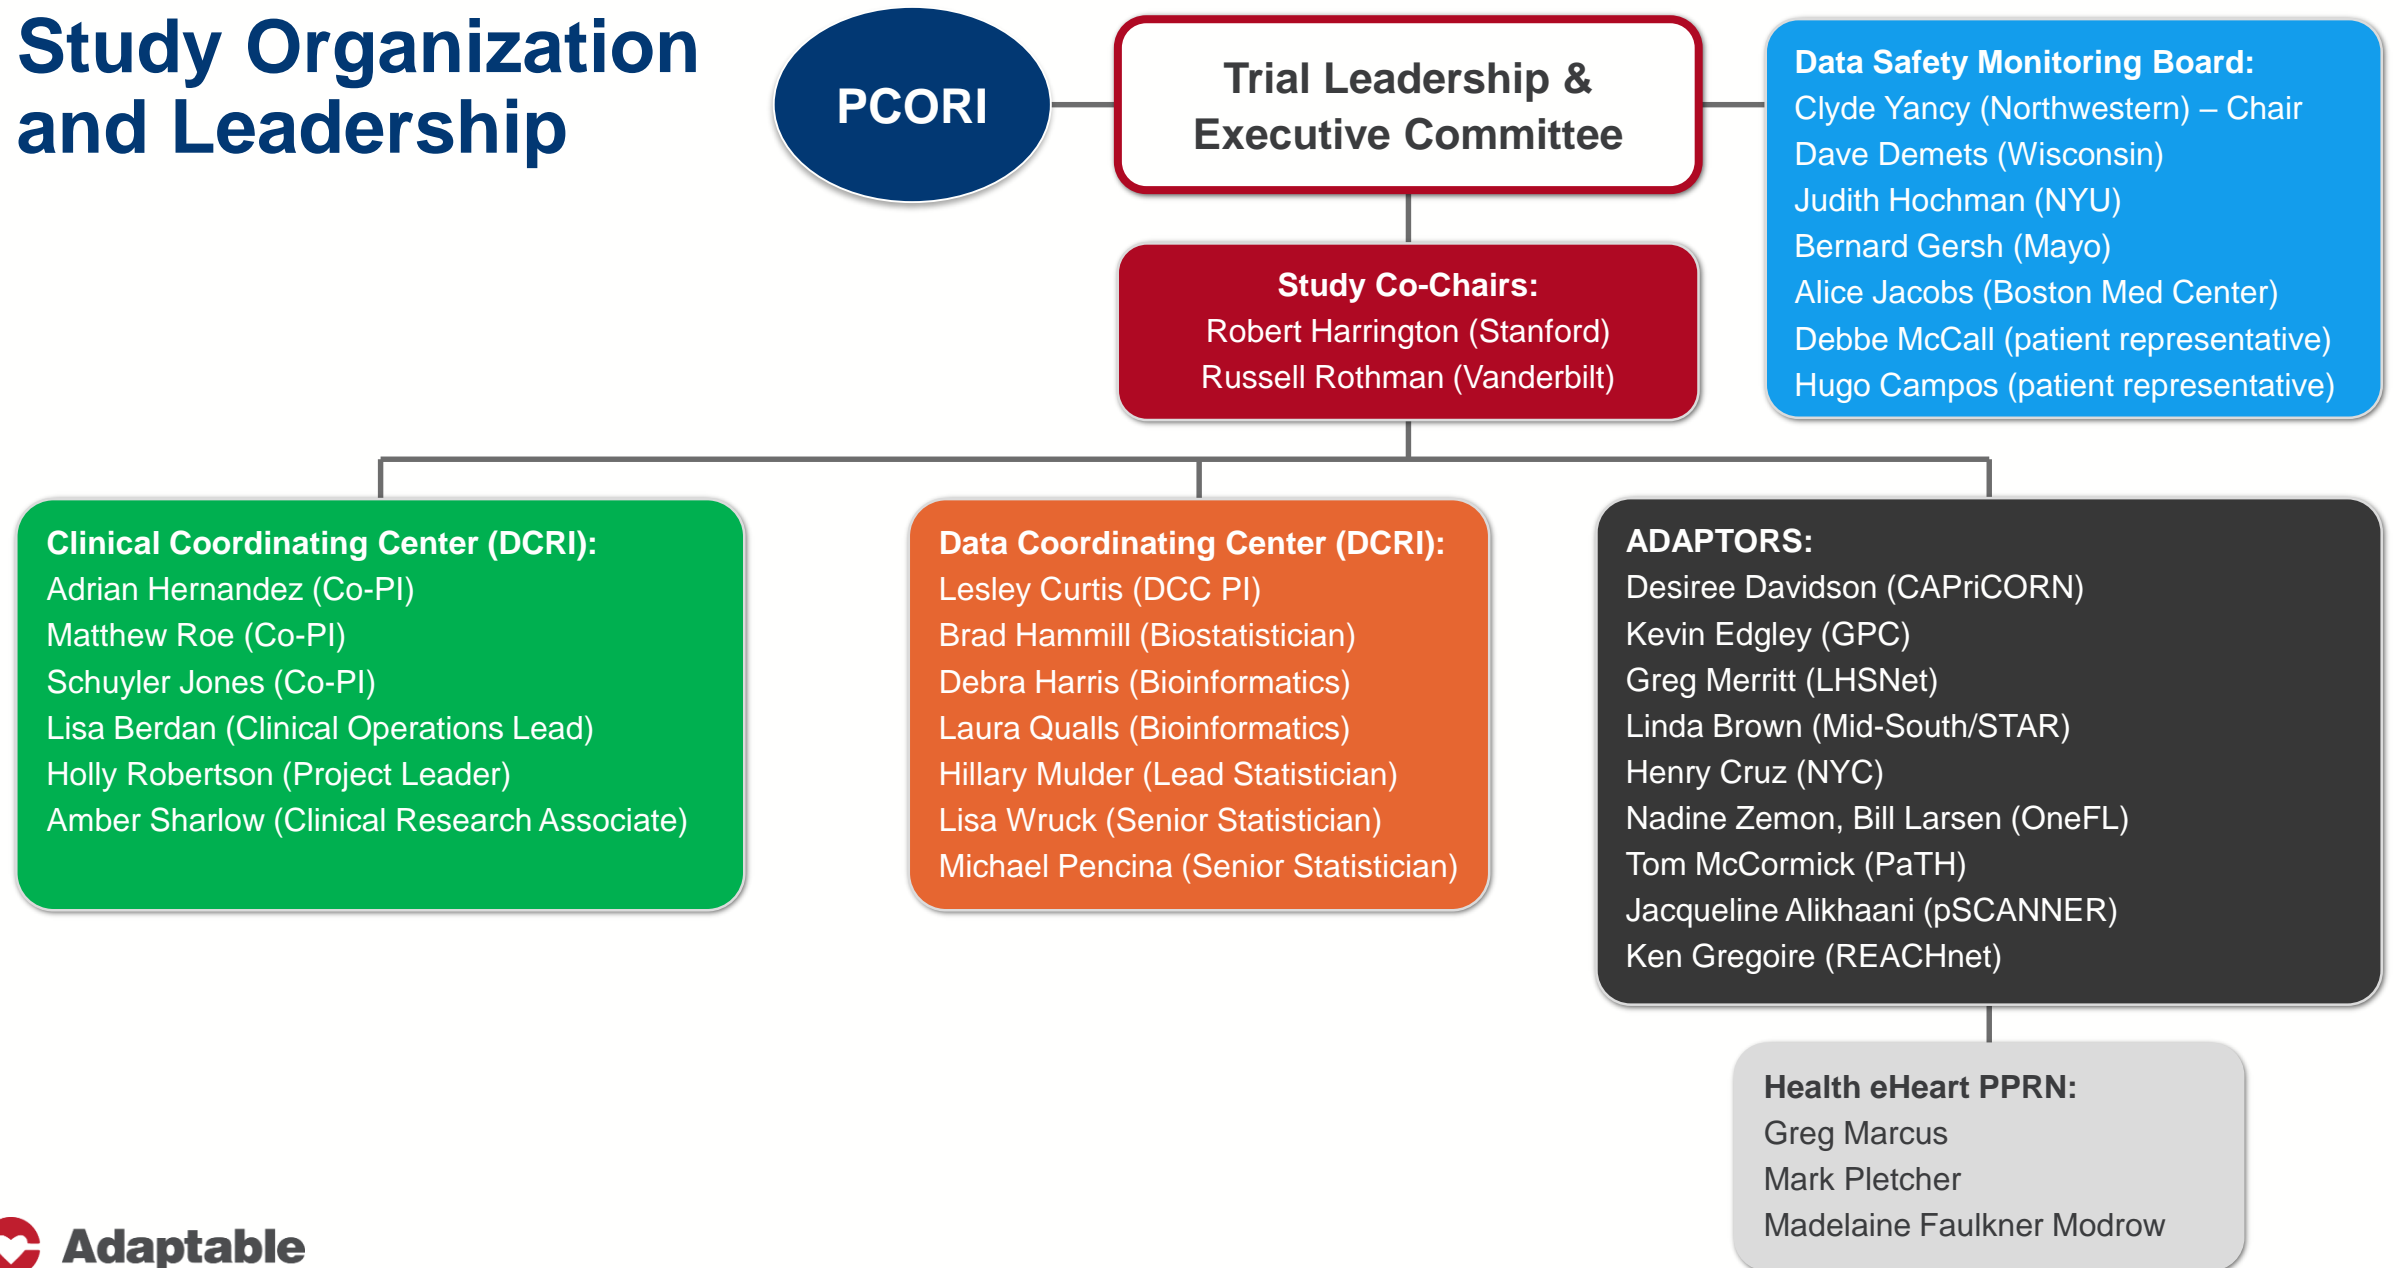

Thanks!
